Skipily – Product variants

Product variants (diameter, size, color)

Some products come in several versions, e.g. rope in different diameters or clothing in sizes and colors. In Skipily you define **options** (e.g. "Diameter") with **values** (e.g. 6mm, 8mm, 10mm). Each combination is a **variant** with its own price, stock and optional SKU.

Three ways:

1) In the provider portal (manual)

Open the product and go to the "Variants" section. Add options and values; for each combination enter price, stock and SKU.

2) CSV/Excel import

Several rows with the **same product name** become ONE product with variants. Additional columns:

Column	Meaning
`variante1_name`	name of the 1st option, e.g. Diameter
`variante1_wert`	value of this row, e.g. 8mm
`variante2_name` / `variante2_wert`	optional second option (e.g. color)
`variante_preis`	price of this variant
`variante_bestand`	stock of this variant
`variante_sku`	SKU of this variant
`variante_bild`	optional image URL of the variant

Tip: use **"Export inventory"** to download your current products already in the new format, add variants and re-import the file.

3) Product API (POST/PUT)

Send `variant_options` (definition) and `variants` (combinations). On POST/PUT, `variants` replaces **all** existing variants (empty array = delete):

```
{
  "name": "Liros Race SK78",
  "price": 100.0,
  "variant_options": [{ "name": "Durchmesser", "values": ["6mm", "8mm"] }],
  "variants": [
    { "attributes": { "Durchmesser": "6mm" }, "price": 100.0, "stock_quantity": 20, "sku": "SK78-6" },
    { "attributes": { "Durchmesser": "8mm" }, "price": 120.0, "stock_quantity": 15, "sku": "SK78-8" }
  ]
}
```

Orders: on a purchase, the API and webhook include the chosen variant per line

item: `variant_sku` and the attributes (`attributes`, e.g. `{"Durchmesser":"8mm"}`). That way your system knows exactly which variant was ordered.

Product images (up to 5)

Up to **5 images** per product are possible. In the shop the customer browses the images by **swiping** or using the **arrows** (iOS and web). The first image is the **cover**.

In the provider portal: under "Product images" upload several images (multi-select) or paste image URLs. Use "Set as cover" to choose the first image and the X to remove one.

CSV/Excel: the cover goes into `image_url` (alias `bild1`). Add further images in these columns:

Column	Meaning
`image_url` / `bild1`	cover (image 1)
`bild2`	second image (URL)
`bild3`	third image (URL)
`bild4`	fourth image (URL)
`bild5`	fifth image (URL)

"Export inventory" writes these columns too, so the file can be re-imported one to one. Via the product API you fill the same through the `images` field (array of URLs). Note: images are always shown in **full** in the product view (never cropped), regardless of aspect ratio.
